The claimed invention

The claimed invention relates to the problem concerning implementing remote controlling of automatic milking systems. The problem is solved by creating web documents containing information obtained at the milking station and transmitting these documents to the system supervisor. The supervisor can the received information appropriate action by remote controlling the milking stations.

Prior art

In the International Search Report the following documents were cited:

D1: WO 9930277

D2: WO 0197556

D3: WO 9951083

D4: US 2002124803

D5: EP 1212936

D6: EP 1212938

D1 describes a system for remote supervising an automatic milking system. The animals are in D1 monitored by cameras. The person supervising can detect problems by watching the images transmitted from the stables to the remote control site. The supervisor can also be alerted by an alarm signal generated by the system. The supervisor can then as a response to the detected problem perform suitable actions in the stable through the internet. (See page 3, line 27 - page 4, line 4; page 4, line 20-22; page 12, line 1-22.)

INTERNATIONAL PRELIMINARY REPORT ON PATENTABILITY

International application No.

PCT/SE2004/000773

Supplemental Box

In case the space in any of the preceding boxes is not sufficient. Continuation of: $Box\ V$

D2 describes a network based sensor system, in which a user can monitor sensed information by logging in to an internet web page. In the web page information gathered by the sensors is showed. A dairy farm is given as an example of systems that can be supervised. (Se page 1, line 8-10; page 6, line 29 page 7, line 14; page 14, line 17-20; claim 1; figures 1B and 3.)

Documents D3-D6 represent the prior art. The claimed invention is not considered to be anticipated by these documents.

Statement of reason

None of the cited documents shows a supervision system, in which an arbitrary mobile communications unit is used for receiving customised information and for inputting settings for the system.

The cited documents represent the general state of the art. The invention defined in claims 1-21 is not disclosed by any of these documents.

The cited prior art does not give any indication that would lead a person skilled in the art to the claimed automatic milking remote supervision. Therefore, the claimed invention is not obvious to a person skilled in the art.

Accordingly, the invention defined in claims 1-21 is novel and is considered to involve an inventive step. The invention is industrially applicable.

Amended Claims

5

10

15

20

25

30

1. A method for remote supervision of an automatic milking system (1) being adapted to handle animals and comprising at least one milking station (2) and computer means characterised in that said method comprises the steps of

obtaining information about said milking station (2) and/or said animals from said computer means,

creating web-documents containing the obtained information about said milking station (2) and/or animals,

establishing a connection between the automatic milking system (1) and a mobile communication unit (8), and

transmitting created web-documents to the communication unit (8), and

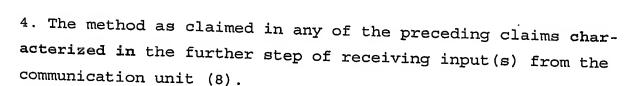

customizing said web-documents to the mobile communication unit (8) before transmitting it to the mobile communication unit (8), and

that the computer means in said automatic milking system (1) receives specific instructions from the communication unit

- (8) input by a user of the communication unit (8) by means of a user interface, whereby settings of said milking station (2) can be remote manipulated by means of said communication unit (8).
- 2. The method as claimed in claim 1, characterized in that said step of creating a web-document comprises using a web-server (10) including a program for creating web-documents.
- 3. The method as claimed in claim 1 or 2, characterized in that the step of customizing web-documents consists in one or more of the following steps: sending only requested information, sending only predetermined information, sending information in dependence on the capacity of the communication unit (8).

The Swedish Patent Office

PCT International Application

5. The method as claimed in any of the preceding claims characterized in that the establishment of a connection between the automatic milking system (1) and the communication unit (8) is initiated either from the communication unit (8) or the automatic milking system (1).

5

15

20

25

30

- 6. The method as claimed in claim 5, characterised in that the connection between the automatic milking system (1) and the communication unit (8) is established upon the occurrence of a certain event.
 - 7. The method as claimed in any of the preceding claims characterized in that said mobile communication unit (8) is selected to be any of the group: laptop computer, PDA or mobile telephone (8).
 - 8. The method as claimed in any of the preceding claims, characterized in that said computer means comprises two or more computers handling different functions in the automatic milking system (1).
 - 9. The method as claimed in claim 8, characterized in that a first computer comprises a database including information about the herd being handled by the automatic milking system (1), and another computer handles the functions of the automatic milking system (1).
 - 10. The method as claimed in any of the preceding claims, characterized in that said automatic milking system (1) includes at least one camera (11) for enabling the sending of images of the at least one milking station (2) and/or animals to a communication unit (8).

- 11. A system for remote supervision of an automatic milking system (1) being adapted to handle animals and comprising at least one milking station (2) and computer means characterised in that the system includes means (10) for creating web-5 documents containing information about said milking station (2) and/or said animals obtained from said computer means, means for establishing a connection between the automatic milking system (1) and a mobile communication unit (8), and means (10, 6) for transmitting created web-documents to a communication unit (8), and means for customizing said web-10 documents to the mobile communication unit (8) before transmitting a created web-document to the mobile communication unit (8), and the computer means in said automatic milking system (1) receives specific instructions from the communication unit (8) input by a user of the communication unit (8) by 15 means of a user interface, whereby settings of said milking station (2) can be remote manipulated by means of said communication unit (8)..
- 12. The system as claimed in claim 11, characterized in that said means (10) for creating a web-document comprises a web-server including a program for creating web-documents.

25

- 13. The system as claimed in claim 12, characterized in that the means for customizing comprises means for performing one or more of the following: sending only requested information, sending only predetermined information, sending information in dependence on the capacity of the communication unit (8).
- 14. The system as claimed in any of claims 11-13, characterized in that said mobile communication unit (8) is any of the group: laptop computer, PDA or mobile telephone (8).
- 30 15. The system as claimed in any of claims 11-14, characterized in that said computer means comprises two or more com-

2 9 -08- 2005

puters handling different functions in the automatic milking system (1).

16. The system as claimed in claim 15, characterized in that a first computer comprises a database including information about the herd being handled by the automatic milking system (1), and another computer handles the functions of the automatic milking system (1).

5

10

15

- 17. The system as claimed in any of claims 11-16, characterized in that said system includes a camera (11) for enabling the sending of images of the at least one milking station (2) and/or animals to a communication unit (8).
- 18. The system as claimed in any claims 11-17, characterized in that the system includes means for establishing the connection between the automatic milking system (1) and the communication unit (8) upon a certain event.
- 19. The system as claimed in claim 18 characterized in that the establishment of a connection is initiated either from the communication unit (8) or the automatic milking system (1).
- 20. The system as claimed in any of claims 18-19, characterized in that the connection between a communication unit (8)
 and the milking station (2) is a wide band connection such as
 fibre, satellite, (V)LAN, radio or ADSL.
- 21. The system as claimed in any of claims 11-20, characterized in that the system includes means for receiving input being sent from the communication unit (8).
